

# Cleaning the air - is your workplace **safe?**

**Covid-19 ventilation guidance published by CIBSE last month has specific and important advice for ventilation and air conditioning systems in the UK**

The government's Chief Scientific Advisor has acknowledged that airborne transmission is a route for Covid-19, particularly in poorly ventilated spaces. As a result they are advising that workplaces boost ventilation so that indoor air is sufficiently diluted to eliminate the potential for airborne viral transmission

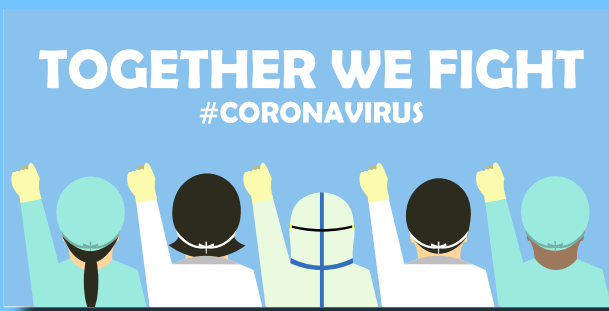

## Key actions you need to take

- Understand the ventilation system within your building
- Run ventilation at higher-volume flowrates
- Avoid recirculation of air from one room to another
- Recirculation of air within a single room where this is complemented by an outdoor air supply is acceptable
- If applicable, thermal wheels should be switched off but maintain the pressure difference between supply and extract to minimise any leakage flow

We can help you to keep your workplace **safe**
